                                                                        В
                                                                                                  cc introducing, into a non-human animal tissue or target cell a nucleic caid comprising the transgene and encoding a transcript (T1); and cc a nucleic acid that encodes a transcript (T2) that inhibits T1
cc specifically. Both nucleic acids are co-expressed so that activity of CT is inhibited constitutively by T2. The nucleic acids are controlled by a transcriptional promoter and the activity of T2 and/or T1 can be regulated by an external agent. The method is used to regulate a cut transgene, in animals and plants, particularly for control of therapeutic cut transgenes in treatment of genetic anomalies and defects, e.g. cut transgenes in treatment of genetic anomalies and defects, e.g. cut casses, hormonal disorders, haemophilia, inflammation (rheumatoid colorarthritis), beta-thalassemia, cancer (by inducing apoptosis or expression of toxins), neurodegeneration, cardiovascular diseases (hypertension), hyperlipidaemia (obesity), and in preparation of coxaccines. Transgenic animals containing T1 and T2 are useful as experimental models of diseases and transgenic plants are useful for studying the effects of specific genes on development etc.

                                                                                                                                                                                                                                                                                                                                                                                                             receptor (PPAR)alpha. This receptor may be used to regulate expression of a transgene. The specification describes a method for regulating expression of a selected transgene in vivo. The method comprises
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 transgene; mitochondrial disease; myopathy; ischaemia; stenosis; lysosomal storage disease; hormonal disorder; haemophilia; inflammation; rheumatoid polyarthritis; beta-thalassemia; cancer; neurodegeneration; cardiovascular disease; hypertension; hyperlipidaemia; obesity;

transcriptional promoter. (A), and vectors containing (A1) and (A2), are used to express (I) in cells for expression of transgenic (I) for expression of transgenic (I) for experimental, clinical, therapeutic or diagnostic purposes. (I) encodes an agriculturally useful, therapeutic, vaccinating or marker protein and is most especially expressed in human muscle cells. Cells containing (A), or the vectors, are used to identify PPAR Ilgands or to produce transgenic animals for preclinical studies, analysis of bioavailability, labelling etc. The present sequence is the E/F domain of human PPARgamma2gamma2, which was used in an example from the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a composition (A) comprising a compone (A1) containing a nucleic acid (I) controlled by an inducible promoter that consists of a PPAR (peroxisome proliferator-activated receptor) response element (ABL58055) and a minimal promoter; and/or a component (A2) comprising a nucleic acid encoding a PPAR under control of a proposition of a nucleic acid encoding a PPAR under control of a proposition of a nucleic acid encoding a PPAR under control of a proposition of a nucleic acid encoding a PPAR under control of a proposition of a nucleic acid encoding a PPAR under control of a proposition of a nucleic acid encoding a PPAR under control of a proposition of a nucleic acid encoding a PPAR under control of a proposition of a nucleic acid encoding a PPAR under control of a proposition of a nucleic acid encoding a ppart and a nucleic acid encoding a nucleic acid 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Composition providing inducible expression of a nucleic gene therapy, uses minimal promoter with peroxisome proliferator-activated receptor response elements -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Example 5; Page 34; 94pp; French.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      cycle enzymes. Peroxisome proliferators include unsaturated fatty acids, hypolipidemic drugs, and herbicides. PPARgamma has two main subtypes (hPPARgamma, and hPPARgamma), which differ in their N-terminal sequences, and are expressed at high levels in adipose tissue. HPPARgamma proteins repress hPPARalpha activity. These proteins can be used in a cell system with a reporter gene (and optionally a hPPARalpha protein) to identify agonists and antagonists of the polypeptides, which can be used as therapeutic agents. The agonists and antagonists can be used to treat obesity, diabetes, anorexia, hyperlipidaemia, hyp
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                sequences differ in their N-Lermina, sequences, and respiration enzymes for cholesterol and lipid metabolism, and respiration enzymes to recovisome proliferators increase the capacity of the peroxisomes to metabolise fatty acids, via increased expression of the beta-oxidation metabolise fatty acids, via increased expression of the beta-oxidation metabolise fatty acids, via increased expression of the beta-oxidation metabolise fatty acids, via increased expression of the beta-oxidation metabolise fatty acids, via increased expression of the beta-oxidation metabolise fatty acids, via increased expression of the beta-oxidation metabolise fatty acids, via increased expression of the beta-oxidation metabolise fatty acids, via increased expression of the beta-oxidation metabolise fatty acids, via increased expression of the beta-oxidation metabolise fatty acids, via increased expression of the beta-oxidation metabolise fatty acids, via increased expression of the beta-oxidation metabolise fatty acids, via increased expression of the beta-oxidation metabolise fatty acids, via increased expression of the beta-oxidation metabolise fatty acids, via increased expression of the beta-oxidation metabolise fatty acids, via increased expression acids                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human peroxisome proliferator activated receptor(s), hPPAR-gamma and hPPAR-gamma2 - useful to identify polypeptide (ant)agonists to treat e.g. obesity, anorexia and diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAR99326-R99328 represent the three different subtypes of human peroxisome proliferator activated receptor gamma2 (hPPARgamma2) sequences differ in their N-terminal sequences.                                        The invention is useful for treating cancer and other disorders including excessive cell proliferation and viral infection. The invention is also directed to the use of PPAR gammal and gamma2 to identify compounds that are antiproliferative, antiviral and antitumour agents. The invention
composition comprising thiazolidinedione in an amount modulate PPAR gammal and gamma2 activity. The present
                             also relates to a method of treating cancer using a pharmaceutical

The present invention relates to antisense oligonucleotides (see AAF23652-F23731), targeted to a nucleic acid molecule encoding human PPARgamma, which specifically hybridises with and inhibits the expression of human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           PPARGamma. The present sequence is human pPARgamma. The antisense oligonucleotides of the present invention can diagnosis and treatment of diseases associated with the PPARgamma, e.g. to prevent or delay infection, inflammat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Example 13; Column 45-48; 40pp; English

                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an oncogene designated PAX8-PPARgammal that contains a PAX8 coding region fused to PPARgammal coding region. The PAX8-PPARgammal polypeptides can be expressed by standard recombinant methodology. A PPARgamma ligand or agent is useful for treating a subject having a disorder characterized by the presence of a PAX8-PPARgammal, where the disorder is cancer, e.g. follicular carcinoma. The PAX8-PPARgammal molecules are also useful for providing nucleotide and amino acid sequences useful for detecting the above disease. The present sequence represents a human PAX8e9(-exon 8)-PPARgammael

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   밁
                                            The invention relates to an oncogene designated PAX8-PPARgammal that contains a PAX8 coding region fused to PPARgammal coding region. The PAX8-PPARgammal polypeptides can be expressed by standard recombinant methodology. A PPARgammal ligand or agent is useful for treating a subject having a disorder characterized by the presence of a PAX8-PPARgammal, where the disorder is cancer, e.g. follicular carcinoma. The PAX8-PPARgammal molecules are also useful for providing nucleotide and amino acid sequences useful for detecting the above disease. The present sequence represents a human PAX8e9-PPARgammael polypeptide.
                                                                                                                                                                                                                                                                                                                            Claim 16;
     Sequence
                                                                                                                                                                                                                                                                                                                                                                      New PAX8-PPARc1 oncogene and oncoprotein, useful for detecting treating certain tumors or cancers, e.g. follicular carcinoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                              N-PSDB; AAH76283.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             20-JAN-2000; 2000US-0177109.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an oncogene designated PAX8-PPARgammal that contains a PAX8 coding region fused to PPARgammal coding region. The PAX8-PPARgammal polypeptides can be expressed by standard recombinant methodology. A PPARgamma ligand or agent is useful for treating a subject having a disorder characterized by the presence of a PAX8-PPARgammal, where the disorder is cancer, e.g. follicular carcinoma. The PAX8-PPARgammal molecules are also useful for providing nucleotide and amino acid sequences useful for detecting the above disease. The present sequence represents a human PAX8e7-PPARgammael polypeptide.

Peroxisome proliferators increase the capacity of the peroxisomes to metabolise fatty acids, via increased expression of the beta-oxidation cycle enzymes. Peroxisome proliferators include unsaturated fatty acids, hypolipidemic drugs, and herbicides. PPARqamma has two main subtypes (hPPARqamma, and hPPARqamma2), which differ in their N-terminal sequences, and are expressed at high levels in adipose tissue. hPPARqamma proteins repress hPPARalpha activity. These proteins can be used in a cell system with a reporter gene (and optionally a hPPARalpha protein) to identify agonists and antagonists of the polypeptides, which can be used as therapeutic agents. The agonists of the polypeptides, which can be used to treat obesity, diabetes, anorexia, hyperlipidaemia, hyperlipidaemia, hyperlipidaemia, hyperlipidaemia, hyperlipidaemia, hyperlipidaemia, hyperlipidaemia, hyperlipidaemia, hyperlipidaemia, and antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim

                                                                                                                                                                                                  The invention relates to an oncogene designated PAX8-PPARgammal that contains a PAX8 coding region fused to PPARgammal coding region. The PAX8-PPARgammal polypeptides can be expressed by standard recombinant methodology. A PPARgamma ligand or agent is useful for treating a subject having a disorder characterized by the presence of a PAX8-PPARgammal, where the disorder is cancer, e.g. follicular carcinoma. The PAX8-PPARgammal molecules are also useful for providing nucleotide and amino acid sequences useful for detecting the above disease. The present sequence represents a human PAX8e8-PPARgammael polypeptide.
                                                                                                                                                                             Sequence

```

AAR99323-R99325 represent the three different subtypes of human peroxisome proliferator activated receptor gamma (hPPARgamma). These sequences differ in their N-terminal sequences. Peroxisomes contain enzymes for cholesterol and lipid metabolism, and respiration. Peroxisome proliferators increase the capacity of the peroxisomes to metabolise fatty acids, via increased expression of the beta-oxidation peroxisome proliferators include unsaturated fatty

PPARgamma has two main subtypes (hPPARgamma, and hPPARgamma2), which differ in their N-terminal sequences, and are expressed at high levels in addpose tissue. hPPARgamma proteins repress hPPARalpha activity. These proteins can be used in a cell system with a reporter gene (and optionally a hPPARalpha protein) to identify agonists and antagonists of the polypeptides, which can be used as therapeutic agents. The agonists and antagonists can be used to treat obesity, diabetes, anorexia, hyperlipidaemia, hereal the approach of the polyperion because the protein the protein that the protein the p

These CS sequences differ in their N-terminal sequences. Peroxisomes contain CC enzymes for cholesterol and lipid metabolism, and respiration. Peroxisome proliferators increased expression of the beta-oxidation CC metabolise fatty acids, via increased expression of the beta-oxidation CC cycle enzymes. Peroxisome proliferators include unsaturated fatty CC acids, hypolipidemic drugs, and herbicides. PARgamma has two main CC subtypes (hPPARgamma, and hPPARgamma2), which differ in their N-terminal CC sequences, and are expressed at high levels in adipose tissue. PPARgamma proteins repress hPPARgamma2), which differ in their Can be used in a cell system with a reporter gene (and optionally a hPPARgahma CC can be used as therapeutic agents. The agonists and antagonists can be used to treat obesity, diabetes, anorexia, hyperlipidaemia, and other metabolic CC disorders. These sequences, the DNA encoding them, and antibodies can be used to treat obesity, diabetes, anorexia, hyperlipidaemia, and onther metabolic constitutes for hepargameas.

                                                                                                                                                                                                                                              The invention relates to compounds and ligands that bind to human peroxisome proliferator activated receptors (PPAR) gammal and gamma2. The invention is useful for treating cancer and other disorders including excessive cell proliferation and viral infection. The invention is also directed to the use of PPAR gammal and gamma2 to identify compounds that are antiproliferative, antiviral and antitumour agents. The invention also relates to a method of treating cancer using a pharmaceutical composition comprising thiazolidinedione in an amount sufficient to modulate PPAR gammal and gamma2 activity. The present sequence is human peroxisome proliferator activated receptor (PPAR) gamma1 protein related
                                                                                                                                                                                                               Sequence

                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to compounds and ligands that bind to human peroxisome proliferator activated receptors (PPAR) gammal and gamma2. The invention is useful for treating cancer and other disorders including excessive cell proliferation and viral infection. The invention is also directed to the use of PPAR gammal and gamma2 to identify compounds that are anniproliferative, antiviral and antitumour agents. The invention also relates to a method of treating cancer using a pharmaceutical composition comprising thiazolidinedione in an amount sufficient to modulate PPAR gammal and gamma2 activity. The present cDNA sequence encodes human peroxisome proliferator activated receptor (PPAR) gamma2 protein related to the invention.

The PAX8-PPARgammal polypeptides can be expressed by standard recombinant methodology. A PPARgamma ligand or agent is useful for treating a
                                                                                                                                                                                                                                                                                                                                                           subject having a disorder characterized by the presence of a PAX8-PPARgammal, where the disorder is cancer, e.g. follicular carcinoma. The PAX8-PPARgammal molecules are also useful for providing nucleotide and amino acid sequences useful for detecting the above disease. The

           specifically hybridises with and inhibits the expression of human PPARgamma. The present sequence is the coding sequence for human PPARgamma artisense oligonucleotides of the present invention can be used in the diagnosis and treatment of diseases
                                                   Peroxisome proliferator-activated receptors (PPARs) are members of the nuclear hormone receptor subfamily of transcription factors. The present invention relates to antisense oligonucleotides (see AAP33652-F23731), targeted to a nucleic acid molecule encoding human PPARgamma, which
                                                                                                       Example 13;
                                                                                                                                   Novel antisense compounds capable of modulating expression of peroxisome proliferator-activated receptor gamma useful for diagrophylaxis and treatment of diseases associated with expression
                                                                                                                                                                                                          McKay

This sequence cc encodes three different hPPARgamma2 subtypes, which differ in their CC N-terminal sequences. Peroxisomes contain enzymes for cholesterol and CC lipid metabolism, and respiration. Peroxisome proliferators increase the C capacity of the peroxisomes to metabolise fatty acids, via increase the C capacity of the beta oxidation cycle enzymes. Peroxisome proliferators increased CC include unsaturated fatty acids, hypolipidemic drugs, and herbicides. CC phargamma has two main subtypes (hPPARgamma, and hPPARgamma2), which CC differ in their N-terminal sequences, and are expressed at high levels in CC adipose tissue. hPPARgamma proteins repress hPPARalpha activity. The CC encoded proteins can be used in a cell system with a reporter gene (and CC optionally a hPPARalpha protein) to identify agonists and antagonists of the polypeptides, which can be used as therapeutic agents. The agonists CA hyperlipidaemia, hypercholesterolaemia, because in them, can be used to treat obseity, diabetes, anorexia, and content of the proposed contents. This sequence, the encoded proteins, and antibodies against them, can be used to establish a tissue specific expression
